

Intro

For learning, I like to use LLMs to ask questions, get recommendations or review what I could do better with code I've written. Usually it is very straight forward and helping, but there are some occurrences, which are just wrong, or maybe even dangerous. For example I had some recommendations from LLMs how to write something, what would create security issues.

In this book I want to document those hallucinations. The purpose is neither bashing LLMs, nor glorifying it. It is a tool, like a knife. It can be helpful and harmful. It depends how you use it, and you should use it always with care.

The purpose is for entertainment purpose, to see what errors some LLMs make, and on the other side, for educational purpose, how wrong LLMs can be, and how to handle situations without LLMs.
