

Serde

Serde (**S**erialize and **D**eserialize) is a library to serialize and deserialize data to or from a struct. This is usually used with language based crates like **serde_json** for JSON or **serde_yaml** for YAML.

To use it, install it, and then you can use the derives on your structs.

```
cargo add serde --features derives
cargo add serde_json
```

```
#[derive(Serialize, Deserialize)]
struct MyData {
    name: String,
    #[serde(rename = "invoiceAddress")]
    invoice_address: InvoiceAddress,
    #[serde(skip)]
    do_not_serialize: bool,
}
```
